

Chapter 3

Applications of Derivatives

3.2 The Mean Value Theorem

The following graphs have a common geometric property. Which one?

(b)

(c)

Is there a condition that guarantees the graph of a function has horizontal tangents?

Rolle's Theorem Let f be a function that satisfies the following three hypotheses:

1. f is continuous on the closed interval $[a, b]$.
2. f is differentiable on the open interval (a, b) .
3. $f(a) = f(b)$

Then there is a number c in (a, b) such that $f'(c) = 0$.

EXAMPLE 2 Prove that the equation $x^3 + x - 1 = 0$ has exactly one real root.

INT: $f(x) = x^3 + x - 1$.

$$[a, b] = [0, 1].$$

$$f(0) = -1 \quad \text{and} \quad f(1) = 1$$

Here, $-1 < \underset{\substack{\text{"N"} \\ 0}}{0} < 1 \Rightarrow$ there is a c
between 0 and 1
s.t. $c^3 + c - 1 = 0$.

Rolle's Thm. By contradiction.

Suppose there is another d s.t.

$$d^3 + d - 1 = 0.$$

Assume $d < c$.

$$\text{So, } f(d) = 0 \quad \text{and} \quad f(c) = 0$$

$$\Rightarrow f(d) = f(c).$$

By Rolle's Theorem, there must be a number x between d and c such that

$$f'(x) = 0.$$

$$\text{We have: } f'(x) = 3x^2 + 1 \geq 1. \quad \rightarrow \times$$

This is our contradiction, so there is only one root c s.t. $c^3 + c - 1 = 0$. \square

The Mean Value Theorem Let f be a function that satisfies the following hypotheses:

1. f is continuous on the closed interval $[a, b]$.
2. f is differentiable on the open interval (a, b) .

Then there is a number c in (a, b) such that

1
$$f'(c) = \frac{f(b) - f(a)}{b - a}$$

or, equivalently,

2
$$f(b) - f(a) = f'(c)(b - a)$$

The Meaning: Find a secant line with the same slope as the tangent line.

Only one c .

Multiple c .

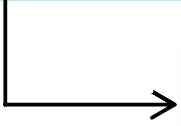

Example

Let $f(x) = \sqrt{x}$. Find the number c that satisfies the conclusion of the Mean Value Theorem on the interval $[0, 4]$.

Consequences of the Mean Value Theorem.

5 Theorem If $f'(x) = 0$ for all x in an interval (a, b) , then f is constant on (a, b) .

7 Corollary If $f'(x) = g'(x)$ for all x in an interval (a, b) , then $f - g$ is constant on (a, b) ; that is, $f(x) = g(x) + c$ where c is a constant.

EXAMPLE 5 Suppose that $f(0) = -3$ and $f'(x) \leq 5$ for all values of x . How large can $f(2)$ possibly be?
