## Chapter 1 Functions and Limits

1.4 The Tangent and Velocity Problems

## The Tangent problem.

Def. In geometry, a <u>tangent line</u> at a given point on a curve is a line that brushes against the curve.

What is the tangent line?

**EXAMPLE 1** Find an equation of the tangent line to the parabola  $y = x^2$  at the point P(1, 1). https://www.desmos.com/calculator/5eyhh9tfkg

**EXAMPLE 2** The flash unit on a camera operates by storing charge on a capacitor and releasing it suddenly when the flash is set off. The data in the table describe the charge Q remaining on the capacitor (measured in microcoulombs) at time t (measured in seconds after the flash goes off). Use the data to draw the graph of this function and estimate the slope of the tangent line at the point where t = 0.04. [Note: The slope of the tangent line represents the electric current flowing from the capacitor to the flash bulb (measured in microamperes).]

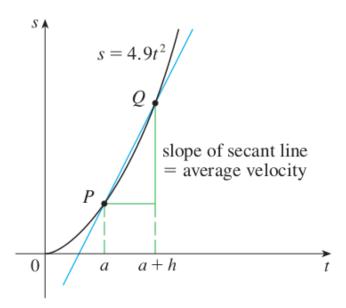

t	Q
0.00	100.00
0.02	81.87
0.04	67.03
0.06	54.88
0.08	44.93
0.10	36.76

## The Velocity Problem.

**EXAMPLE 3** Suppose that a ball is dropped from the upper observation deck of the CN Tower in Toronto, 450 m above the ground. Find the velocity of the ball after 5 seconds.

 ${\it Galileo:}\ s(t)=4.9t^2$ 

Instantaneous Velocity.

Relation to the tangent line.
