Example 4

Does the function
$$f(x) = \begin{cases} 1/x & 0 < x \leq 1 \\ 0 & x = 0 \end{cases}$$

have a maximum?

x	$f(x)$
0.5	2
0.25	4
0.10	10
0.01	100

x	$f(x)$
1	1
0.5	2
0.25	4
0.1	10
0.01	100

- One at $x = 1$ → $f(x) = 1 \leq \frac{1}{x}$ $\forall x \leq 1$. $(x \neq 0)$

- Another one at $x = 0$ → $f(0) = 0 \in 1 \leq \frac{1}{x}$ $\forall x$.

Example 7

Let $f(x) = x^3$. What is $f'(0)$? Is $f(0)$ a local maximum or local minimum?

$f'(x) = 3x^2$

The solution to $f'(x) = 0$

$$\Rightarrow \quad 3x^2 = 0$$

$$\Rightarrow \quad x = 0$$

It seems that $x = 0$ is a local max or local min.

x	$f(x)$
2	8
1	1
0	0
-1	-1
-2	-8

x is not a maximum and not a minimum!

Example 8

Let $f(x) = |x|$. Is $f(0)$ a local maximum, global maximum, local minimum, or global minimum?

the $f'(0)$ ∄

But $f(0) = 0$ is an absolute minimum.

x	$f(x)$
-2	2
-1	1
0	0
1	1
2	2

Example 10

Find the critical numbers of $f(x) = x^{3/5}(4-x)$.

1) Find the derivative

$$f'(x) = (x^{3/5})' (4-x) + x^{3/5} \cdot (-1)$$

$$= \frac{3}{5} x^{-2/5} (4-x) - x^{3/5}$$

$$= \frac{3 \cdot 4}{5} x^{-2/5} - \frac{3}{5} x^{3/5} - x^{3/5}$$

$$= \frac{12}{5} x^{-2/5} - x^{3/5} \left(\frac{8}{5} \right)$$

$$\frac{12}{5x^{2/5}} - \frac{8x^{3/5}}{5} \swarrow$$

$$= \frac{12 - 8x}{5x^{2/5}}$$

$$= \frac{4(3-2x)}{5x^{2/5}}$$

2) Solve $f'(x) = 0$

$$f'(x) = 0 \iff \frac{4(3-2x)}{5x^{2/5}} = 0$$

$$\iff x = \frac{3}{2}$$

3) Find $f'(x)$ where $\nexists$

$f'(x)$ $\nexists$ when $x = 0$

Answer
critical numbers
are $\frac{3}{2}$ & 0

Example 11

Find the absolute maximum and minimum values of the function $f(x) = x^3 - 3x^2 + 1$ on the interval $[-1/2, 4]$.

1) Find the critical numbers.

$$f'(x) = 3x^2 - 6x$$

Solve $f'(x) = 0$ (for x).

$\implies \quad 3x^2 - 6x = 0$

$\implies \quad (3x - 6)x = 0$

$\iff \quad 3x - 6 = 0 \quad$ or $\quad x = 0$

$\iff \quad x = 2 \quad$ or $\quad x = 0$

We have $\qquad f(0) = 1 \quad \& \quad f(2) = -3$.

2) Compute the values of f at endpoints.

$a = \frac{-1}{2} \quad \& \quad b = 4 \qquad f(-1/2) = 1/8$

$\qquad\qquad\qquad\qquad\qquad f(4) = 17$.

3) Take max & min

$\max\{1, -3, 1/8, 17\} = 17$

$\min\{1, -3, 1/8, 17\} = -3$

Answers: abs maximum is 17

abs minimum is -3

Example 12

Show that the equation $x^3 + x - 1 = 0$ has at least one root.

Here $f(x) = x^3 + x - 1$.

$$f(0) = 0 + 0 - 1 = -1 \qquad a = 0$$

$$f(1) = 1 \qquad b = 1$$

So, $f(0) < 0$ & $f(1) > 0$.

So, $\exists c \in (0,1)$ s.t. $f(c) = 0$.

In other words, $c^3 + c - 1 = 0$.

Example 13

$$f(x) = x^3 + x - 1.$$

Show that the equation $x^3 + x - 1 = 0$ has exactly one root.

Suppose that there are two different roots a & b $(a \neq b)$.

So, $f(a) = 0 = f(b)$.

- f is cont. on $[a, b]$
- f is diff. on (a, b).

So, by Rolle's theorem, $f'(c) = 0$ for some $c \in (a, b)$.

$\uparrow$ contradiction.

$f'(x) = 3x^2 + 1 \geq 1$, so $f'(x) \neq 0$.

So, we must conclude that there is only one root.

Example 14

Consider $f(x) = x^2$.

$x^2 = 0^2$ $x^2 = 2^2$

- Find the slope of the secant line passing through $Q = (0,0)$ and $P = (2,4)$.
- Can you find a tangent line to $y = x^2$ with the same slope?

- the slope of PQ

$$m_{PQ} = \frac{y_2 - y_1}{x_2 - x_1} = \frac{4 - 0}{2 - 0} = 2$$

- Here $f(x) = x^2$. We have $f'(x) = 2x$

So,

$$f'(x) = 2 \iff 2x = 2$$
$$\iff \boxed{x = 1}$$

Example 15

Find the numbers $c \in [0, 2]$ such that the average of the function $f(x) = x^3 - x$ on the interval $[0, 2]$ is attained by $f'(c)$.

Here, $\quad a = 0, \quad b = 2$.

$f(x) = x^3 - x \qquad \longrightarrow$

- continuous on $[0, 2]$
- differentiable on $(0, 2)$.

So, $\quad \exists \, c \in (0, 2)$ s.t.

$$f'(c) = \frac{f(2) - f(0)}{2 - 0}$$

$f'(x) = 3x^2 - 1$

$$\frac{f(2) - f(0)}{2 - 0} = \frac{6 - 0}{2} = 3$$

So,

$$3c^2 - 1 = 3$$

$$\Rightarrow \quad 3c^2 = 4$$

$$\Rightarrow \quad \sqrt{c^2} = \sqrt{4/3}$$

$$\Rightarrow \quad |c| = \sqrt{4/3}$$

$$\Rightarrow \quad c = + \sqrt{4/3} \quad \text{or} \quad -\sqrt{4/3}$$

The slope of the tangent line is the same as the slope of the secant if

$$\boxed{x = 2/\sqrt{3}} \quad \text{or} \quad x = -2/\sqrt{3} \quad \longrightarrow \text{does not to } [0, 2].$$

Example 17

Consider $f(x) = x^2$. Where is f increasing? Where is f decreasing? Go to Desmos!

- $\underline{f \text{ increasing.}}$ $\qquad x_1 < x_2$ then $f(x_1) < f(x_2)$

$$\underset{\downarrow}{x_1^2} < \underset{\downarrow}{x_2^2}$$

$$x_1 = 2 \qquad 2 < 3 \implies \underset{\downarrow}{2^2} \qquad \underset{\downarrow}{3^2}$$
$$x_2 = 3$$
$$4 < 9$$

$$x_1 = -2 \qquad -2 < -1 \implies \underset{\downarrow}{(-2)^2} \qquad (-1)^2$$
$$x_2 = -1$$
$$4 > 1$$

Suppose $x_1 > 0$, $x_2 > 0$ and $x_1 < x_2$.

$$x_1^2 < x_2^2 \implies f(x_1) < f(x_2)$$

So, f is increasing when $x > 0$.

- f is decreasing if $x < 0$.

Example 18

If $f(x) = x^3 - x$, find where it is increasing and where it is decreasing. [Go to Desmos]

$$f'(x) = 3x^2 - 1 = (\sqrt{3}\, x - 1)(\sqrt{3}\, x + 1)$$

$$a^2 - b^2 = (a+b)(a-b).$$

Thus $f'(x) = 0$ $\iff$ $\sqrt{3}\, x - 1 = 0$ or

$$\sqrt{3}\, x + 1 = 0$$

$$\iff \quad x = 1/\sqrt{3} \quad \text{or}$$

$$x = -1/\sqrt{3}$$

x		$-1/\sqrt{3}$		$1/\sqrt{3}$	
$\sqrt{3}x+1$	$-$	0	$+$	$+$	$+$
$\sqrt{3}x-1$	$-$	$-$	$-$	0	$+$
$f'(x)$	$+$	0	$-$	0	$+$

$$x < -1/\sqrt{3} \quad \to \quad \sqrt{3}\, x < -1 \to \sqrt{3}\, x + 1 < 0$$

$$x < 1/\sqrt{3} \quad \to \quad \sqrt{3}\, x - 1 < 0$$

So, $f'(x) > 0$ when x is in $(-\infty, -1/\sqrt{3})$ and $(1/\sqrt{3}, \infty) \to f$ is increasing there.

Also, $f'(x) < 0$ when x is in $(-1/\sqrt{3}, 1/\sqrt{3})$ $\to f$ decreases there.

Example 19

Let $f(x) = x^4 - 2x^3$. Find the local maximum and minimum values of f.

$$f'(x) = 4x^3 - 6x^2 = 2x^2(2x - 3)$$

So, $f'(x) = 0 \iff x^2 = 0$ or $2x - 3 = 0$

$\iff x = 0$ or $x = 3/2$.

$x < \frac{3}{2}$

$2x - 3 < 0$

x		$\overset{\downarrow}{0}$		$\overset{\downarrow}{3/2}$	
2	$+$	$+$	$+$	$+$	$+$
x	$-$	0	$+$	$+$	$+$
x	$-$	0	$+$	$+$	$+$
$2x-3$	$-$	$-$	$-$	0	$+$
$f'(x)$	$-$	0	$-$	0	$+$

$x = 0$ is not a local minimum or local max.

$x = 3/2$ is a local minimum.

$$f(3/2) = \frac{3^4}{2^4} - 2 \cdot \frac{3^3}{2^3} = \boxed{}$$

Example 21

Sketch a possible graph of a function f that satisfies the following conditions:

- $f(0) = 0$, $f(2) = 3$, $f(4) = 6$, and $f'(2) = 0$.
- $f'(x) > 0$ for $0 < x < 2$ and $f'(x) > 0$ for $2 < x < 4$.
- $f''(x) < 0$ for $x < 2$ and $f''(x) > 0$ for $x > 2$.
Example 23

Let $f(x) = x^4 - 4x$.

- Find the region where the function is concave upward, concave downward.
- Find the inflection points and the local maxima/minima.
- Use this information to sketch the curve
